

Guilherme Holanda

Senior Software Engineer, Backend & Full Stack

I build products that real businesses use every day: messaging that handles millions of conversations, payments where every cent has to add up, and the tests and pipelines that keep it all working. Most of my work is TypeScript, from NestJS backends to React frontends.

Products I've worked on

Amigo Flow AI messaging hub for clinics, **R\$400K MRR** in 6 months

AmigoPay Banking-as-a-Service for clinics, **BRL 20M+** processed per month

Agende Mais CRM and patient journey automation, campaigns up to **200K** recipients

Amigo One Mobile app for physicians, integrated with Amigo Flow

Signbox Digital signatures with government (ITI) validation for hospitals

Hello Diet SaaS for nutritionists, my Computer Science final project

Main products at Amigo Tech, a clinic management platform used by 50K+ doctors and 5K+ clinics

Amigo Flow

Multichannel AI messaging hub. Clinics set up AI agents with their own knowledge bases, connected to the scheduling API via MCP, so patients can book appointments end to end by voice or text.

R\$400K

MRR within 6 months

10M+

messages in the first 90 days

43%

of conversations resolved without a human

My part

- Core engineer from the first version, and one of the main technical contacts for product and the pilot clinics.
- Designed the event-driven processing for WhatsApp webhooks and campaigns, with Redis queues and Socket.IO for real-time messages.
- Worked closely with the AI team to integrate their agents with our scheduling API through MCP.
- Built scheduling, confirmations, Kanban automation, campaigns and Meta template management.

Stack: NestJS, Node.js, React, Angular, Socket.IO, Redis, PostgreSQL, MongoDB, RAG, MCP, WhatsApp Cloud API, AWS

AmigoPay

Banking-as-a-Service module inside the clinic platform, with digital accounts, PIX, boleto, card terminals, installments, automated accounts payable and access controls by IP, location and device.

BRL 20M+

processed every month

1,000+

clinics using it

0

vulnerabilities in the external pentest

My part

- Built bank account setup and management workflows, and internal transactions between modules.
- Integrated PIX, boleto issuance, card terminals and installment billing.
- Built webhook-driven event tracking, account statements, reconciliation flows and automated payment pipelines.

Stack: NestJS, PostgreSQL, AWS, Dock BaaS, Webhooks, PIX, Boleto

Other products I've contributed to at Amigo Tech

Agende Mais

Omnichannel automation engine for the clinic and patient lifecycle, from first contact to follow-up, on a serverless architecture.

200K

recipients per campaign
dispatch

~R\$500K

per month

My participation

Took part in development, mainly on CRM workflows, campaign automation and patient journey features.

Stack: Node.js, AWS SQS, Lambda, CloudWatch, WhatsApp API, Zenvia, Sinch

Amigo One

Mobile app for physicians with schedule management, patient records, a financial dashboard, invoice (NF) issuance and a specialty-based professional network.

~R\$500K

per month

My participation

Taking part in the integration between Amigo One and Amigo Flow, working alongside the mobile team.

Stack: React Native, NestJS, PostgreSQL

Signbox

Digital signature platform with government validation through ITI and 20-year legal retention, replacing paper documents in hospitals.

R\$150–300K

per month

My participation

Took part in development, implementing features and working through the platform's business rules.

Stack: Node.js, ITI integration, WhatsApp, SMS

Personal project, my B.Sc. final project in Computer Science at UNICAP (2026)

Hello Diet

SaaS platform for nutritionists to manage patients, appointments, clinical records and meal plans in one place, with dashboards that show each patient's progress over time.

3

nutritionists validated the product

150–200 ms

typical API response time

What I built

- Took the product from interviews with nutritionists to data modeling, API design and a working platform.
- Multi-tenant architecture, with each clinic's data isolated so many clinics can share one instance safely.
- JWT authentication with role-based access, audit logs and soft deletes for sensitive records.
- Turned user feedback into a shipped feature: linking each appointment directly to the patient's record.

Stack: React, Zustand, Vite, NestJS, PostgreSQL, Sequelize, JWT

Dashboard with patient and appointment indicators

Weekly appointment calendar

Patient assessments and measurements
